In addition to the alleged shift from traditional to monoculture-style agriculture, another important land-use change has been the recent conversion of paddy land into simple agroforests and other agricultural crops (Guillerme et al., 2011). It is important to note that new agroforests are often fundamentally different than traditional homegarden

The major drivers of land degradation are climate, notably drought, and population density. The pressures include natural resource management and land use/cover change. A Landsat archive analysis showed an increase in agricultural land use from 31% to 50%, mostly at the expense of forests, from 1990 to 2019.
