The evolution of a star can be described in terms of changes in its temperature and luminosity, which can best be followed by plotting them on an H-R diagram. Protostars generate energy (and internal heat) through gravitational contraction that typically continues for millions of years, until the star reaches the main sequence.

The study of magnetic activity in stars has been an important topic in stellar astrophysics. Our understanding of it is very incomplete, even for our own Sun. We know, for example, that the Sun has a 22-year cycle -- the Solar Cycle -- where sunspot activity waxes and wanes, changing magnetic polarity once per 11 years.
